Mist Spray Unit
LMU100/200 Series

CE UK CA

● Intermittent spray to cutting and press gear chains, etc.

LMU100

Standard Specifications

Model	LMU100	LMU200
Inlet air pressure	0.1 to 1.0 MPa	
Oil tank set pressure range	0.05 to 0.2 MPa	
Oil	Turbine oil, Non-water soluble cutting oil (JIS, N1 type)	
Dynamic viscosity of oil (40°C)	2 to 200 mm²/s	
Oil tank capacity (cm³)	Total capacity: 3000	
	Effective capacity: 2500	
Ambient and fluid temperature	5 to 50°C	
Solenoid valve voltage	100 VAC 50/60Hz, 200 VAC 50/60Hz, 24 VDC	
Port size	SUP Rc 1/4	
	OUT 3 x Rc 1/4	AIR : T0604 (ø6 tube) applicable OIL : T0425 (ø4 tube) applicable AIR BLOW : T0806 (ø8 tube) applicable
Weight (kgf)	8.4	7.9

How to Order

LMU 1 00 – 1 3

Mist spray unit

Air blow circuit

1	Available
2	Not available

Rated voltage

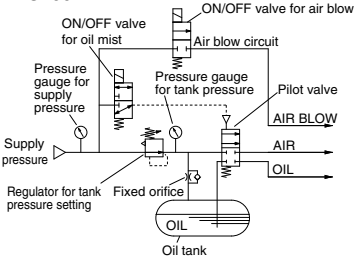
1	100 VAC (50/60 Hz)
2	200 VAC (50/60 Hz)
5	24 VDC

Float switch

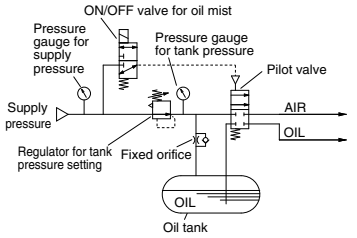
0	None
3	For the upper and lower limit control (SW turns OFF when the float is on the upper side. SW turns ON when the float goes down.) Contact capacity 50 VA AC, 50 W DC

Control Circuit

LMU100-□□



LMU200-□□



Recommended Equipment

It is recommended to use each mist spray unit type with the mixing valves, magnet holders, branch pipes and nylon tubes listed in the table below.

Mist spray unit	Mixing valve	Magnet holder	Branch pipe	Nylon tube
This unit, with an oil tank and a spray ON/OFF control unit, sends oil and air to the mixing valve.	This valve adjusts the amounts of oil and air from the mist spray unit using built-in oil and air needles, and also discharges oil mist from the nozzle.	This magnet holder enables the mixing valve installed on the arm end to be freely attached to the iron and steel parts such as machining tools, etc.	This pipe is used to separate oil and air from the mist spray unit when using several mixing valves.	This tube is used for the air piping and oil piping between the mist spray unit and the mixing valve.

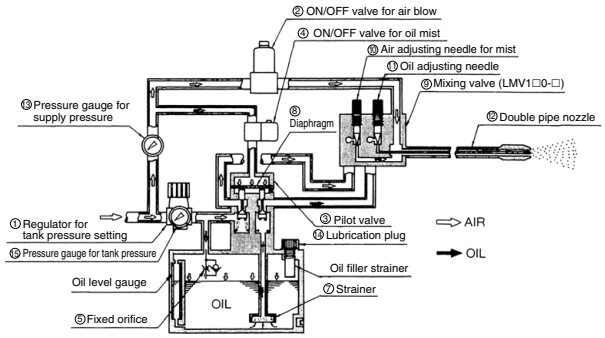
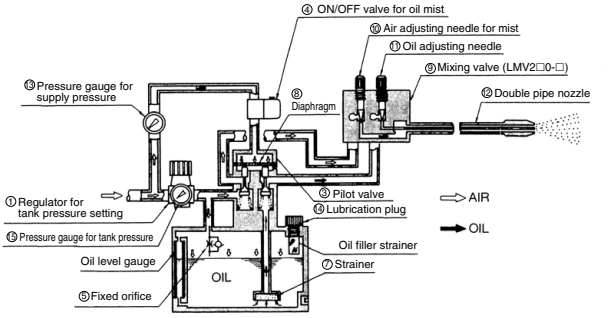
Construction/Working Principle

LMU100-□□



LMU200-□□



Working Principle

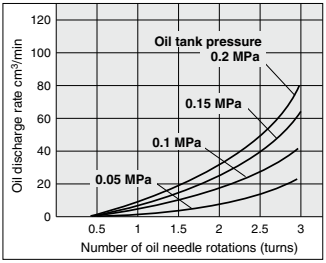
Of the compressed air from the air source, part is directed to the regulator for tank pressure setting (1), while the rest is directed to the ON/OFF valve for oil mist (4), which operates the ON/OFF valve for the air blow circuit (2) and the pilot valve for the mixing circuit (3). Compressed air at a prescribed setting determined by the regulator for tank pressure setting (1) passes through the fixed orifice (5) and gradually fills the oil tank (6), applying pressure to the OIL surface. The OIL in the tank passes through the strainer (7) and is drawn into the pilot valve (3). Operating the ON/OFF valve for oil mist (4) at this point will cause operating signal pressure to be conducted into the pilot valve (3), pushing the diaphragm (8) downwards, and as a result the compressed air from pilot valve (3) and oil from the opened valve will flow through their respective conduits and be drawn into the mixing valve (9).

Air and oil are adjusted with varying quantities by the air for mist from the mixing valve (9) and oil adjustment needles (10) and (11). With dual piping from the mixing valve (9) to the dual pipe nozzle (12), compressed air passes through the outside while oil passes through the inside, and at the tip of the dual pipe nozzle (12) they are sprayed out as a fine mist by the discharged air.

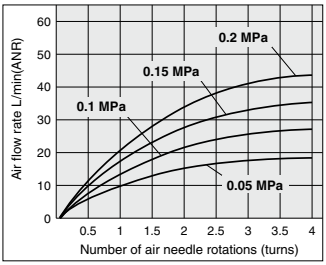
To remove cutting chips, operate the ON/OFF valve for air blow (2), which will cause the supplied compressed air to be drawn directly into the mixing valve (9) and blown out as air through the external piping of the dual pipe nozzle (12). To replenish oil, loosen the oil supply plug (14) to discharge the compressed air from inside the tank through the oil supply plug's side hole. Since it flows gradually from the fixed orifice (5) into the interior of the tank, it is easy to replenish oil from the oil supply hole.

Oil Discharge Rate (Representative Value)

Conditions Oil: Turbine oil class 1 ISO VG32
Oil temperature: 26°C



Air flow rate (Representative Value)



Handling Precautions

Mounting

1. Be sure to mount an air filter corresponding to 5mm (equivalent to the SMC AF20) on the SUP side of the mist spray unit.

Adjustment

1. After loosening the tank's pressure-setting knob (by rotating it to the left), introduce air from the air source. Use the tank's pressure-setting knob and set the range from 0.05 to 0.2 MPa, set each control valve to ON (manual operation or energized), and inspect carefully to make sure there is no looseness in the fittings at each connecting point. At this time, be sure the air and oil adjustment needles of the mixing valve are in a completely closed position (by rotating it to the right.)

Lubrication

1. Completely release air in the OIL pipe. Even small amounts of air in the OIL pipe will cause oil to dribble. Fully open the oil adjustment needle of the mixing valve, and turn the ON/OFF valve for oil mist generation to the ON position, or press and hold down the manual button to release all air from inside the OIL pipe. If air build-up from use of branching pipes, etc. takes place inside the OIL pipe, mount an air release valve at the highest position and let the air out.
   Be sure to carry out this operation when replenishing the oil after the oil tank becomes empty.
